Since we've already worked on multiple pair programming projects, we were able to communicate with each other easily. Like before, we would continually message each other frequently to decide the direction of the project, update one another about the progress and work that was done, and if we had any questions with one another. We also met a couple of times to discuss how we wanted to go about working on this project because it was very open ended.

Essentially the project was divided to where David focused on the backend, doing the network programming and implementing multithreading to set up the Server and Client side of things, whereas Veronica focused on the UI of the project, finding what best matched the functionality that David was looking for in terms of the services that the chatroom would offer. Both David and Veronica worked on incorporating the two together so that the chat room would work and the interface contained a fluid usability to it.
